PROFESSIONAL SUMMARY

AI-native Senior QE who builds the tools that make QA teams faster, not just the test suites. At Evertz, developed 4 internal automation tools (JIRA AI triage agent, lab monitoring dashboard, TSPLAY web UI, firmware upgrade tool) now embedded in daily QA workflows. Deep in Python automation, ETL/database validation, and shift-left testing, with full-stack instincts spanning Flask, CI/CD pipelines, and REST API frameworks. Targeting SDET and Senior QE roles where automation engineering and AI-assisted quality strategy create measurable engineering impact.

CORE SKILLS

QA & Testing: Functional, Regression, System, Integration, Stress/Load testing, ETL/Database, Black-box, White-box, Agile, SDLC, STLC

Automation & Development: Python, Selenium, Robot Framework, Katalon Recorder, React, JavaScript, Node.js, Flask, Pandas, jQuery, Bootstrap, Scripted Validation & QA Workflow Automation

DevOps, Tools & Platforms: Git, GitHub, Bitbucket, Jenkins, JIRA, Confluence, QTest, TestRail, Linux CLI, NGINX, Gunicorn, Cursor, GitHub Copilot, Microsoft Glean

Databases, Networking & Systems: MySQL, Microsoft SQL Server (SSMS), MS Access, Networking Fundamentals (IP, TCP/UDP, Streams), Wireshark, Log Debugging, Windows & Linux Operating Systems

WORK EXPERIENCE

Senior Quality Engineer

Evertz Microsystems Ltd., Burlington, ON

Jan 2023 – Present

Core QA & Automation

- Designed and owned end-to-end test strategy across firmware and software validation covering functional, regression, integration testing driving automation coverage across sprint cycles using Python, Selenium, and Robot Framework.
- Performed database validation using SQL queries, along with system-level testing across firmware/software components in multi-environment lab infrastructure.
- Led regression testing cycles ensuring product stability across releases; conducted deep debugging via Linux CLI, log analysis, and packet-level troubleshooting to verify data integrity.
- Integrated CI/CD pipelines using Jenkins and GitHub for version control and automated build validation across testing environments.

AI Initiatives & Internal Tooling

- Built and deployed JIRA AI triage agent (Glean) that auto-summarizes incoming tickets and surfaces priority signals reducing average ticket triage from ~12 minutes to ~4 minutes per ticket time and eliminating manual ticket scanning across the QA team.
- Developed TSPLAY Web UI (Flask/Gunicorn/NGINX) replacing manual SSH-based CLI workflows with a centralized, user-friendly web interface eliminating complex command memorization and reducing human error in daily QA operations.
- Built Lab Rack Monitoring Tool to track device health and status across testing racks, enabling proactive issue detection and improving lab infrastructure reliability.
- Leveraged GitHub Copilot, Cursor, and Microsoft Glean to accelerate script development, synthesize internal documentation, and prototype automation tools significantly faster.

Collaboration & Delivery

- Collaborated with developers, product managers, and QA leads to identify defects early and improve product quality; participated in design reviews to ensure testability from sprint inception.
- Documented defects, test results, and validation reports in JIRA, Confluence, and QTest; actively drove sprint planning and technical walkthroughs with BAs, developers, and Product Owners.

Student Product Verification Specialist (Co-op)

Evertz Microsystems Ltd., Burlington, ON

Jul 2021 – Dec 2021

- Developed and maintained automation scripts using Python, Selenium, and Robot Framework; performed functional, system, and regression testing across the product line.
- Conducted database validation using SQL and Linux/Unix CLI tools; collaborated cross-functionally during sprint cycles and logged/tracked defects in JIRA.
- Collaborate with developers, product owners, and cross-functional teams during sprint cycles, participating in daily stand-ups, sprint planning, and technical discussions.
- Suggested improvements to testing processes and practices, including enhancements to test strategy, automation standards, and workflow efficiency.

PROJECTS

TSPLAY Web-Based Automation Interface

- Replaced manual CLI-based TSPLAY workflows with a full web UI built with Python (Flask/Gunicorn), deployed via NGINX on internal network; transformed multi-step SSH operations into guided, repeatable actions used daily in QA workflows.

JIRA AI Triage Agent

- Built an AI-powered JIRA triage agent using Glean Agent Builder to automatically scan, summarize, and categorize incoming defect tickets, surface priority/severity signals, and highlight key debugging context reducing manual triage effort, improving response time to critical issues, and accelerating defect investigation workflows across the QA team.

API Test Generation & Execution Framework

- Developed scripts to auto-generate and execute API test cases; integrated into regression workflows to enable consistent validation across system configurations and accelerate defect identification.

Firmware Upgrade & Data Collection Automation Tool

- Built a Python-based desktop CI/CD utility using Tkinter, SSH/SFTP, and Linux shell commands to connect with Linux servers, automate firmware upgrade workflows and data collection across test environments, replace complex multi-step SSH operations with a guided and repeatable process, and generate structured logs/configuration data for easier debugging and validation.

Device Health Monitoring Tool (Lab Infrastructure)

- Developed a Python-based desktop monitoring tool using Tkinter, REST APIs, SSH, and Linux utilities to track rack-level system health and status, enabling proactive detection of lab issues, reducing downtime, and improving testing infrastructure reliability.

EDUCATION

BTech, Software Engineering Technology

McMaster University · Hamilton, ON

May 2025 – Present

Computer System Technician – Software Development

Mohawk College · Hamilton, ON | Overall GPA: 86.7%

Jan 2020 – Dec 2022
